Chapter 1 Practice Key

Energy Causes Change | Ungraded practice | Reader Chapter 1, pages 1-6

Part A What Changed

Scenario	Observable change	Form
Light switch	Room changed from dark to bright	light or electrical energy
Toy car	Car changed from still to moving	motion
Bell	Quiet changed to a ringing sound	sound
Ice cube on warm hand	Ice melted or became smaller	heat

Part B Evidence or Not Enough Evidence

Observation	Answer	Because
Fan blades started spinning when plugged in	EVIDENCE	still to moving is an observed change
Battery looks shiny	NOT ENOUGH	looking shiny does not show a change
Room got brighter when the light came on	EVIDENCE	dark to bright is a change
I think the motor is strong	NOT ENOUGH	this is an opinion; no change was observed

Part C Stored Energy

Example	Answer	Expected explanation
Battery in switched-off flashlight	YES	When switched on, it can make the bulb light.
Apple held above the ground	YES	If released, it can fall because of its position.
Stretched rubber band	YES	If released, it can snap back and may make sound.
Toy car rolling	NO - happening now	Its energy is in its motion now, not stored for later.

Part D Explain

Sample: I flipped a switch and the room changed from dark to bright. A change is evidence of energy, so the light shows energy was at work.

Accept any response that names an observed change and connects that change to evidence of energy. Do not require stored energy. Accept proof once, then restate evidence.

Teacher Note

The bell and ice-cube rows are everyday EXTENSION examples. Accept any reasonable observable change and one of the five taught forms.
